VEGETABLES - FRESH MARKET

ANNUAL SUMMARY

1968

In 1968, production was 1 percent more than in 1967 for the 27 principal fresh market vegetables and melons, the Crop Reporting Board announced today. The 1968 production of 227 million hundredweight compares with 1967 production of 224 million hundredweight and the average annual production of 216 million. Crops making major contributions to this year's increased production from 1967 were lettuce, cantaloups, and carrots. Record high production was estimated for broccoli, lettuce, onions, and green peppers. The 27 principal vegetable and melon crops had a total value of \$1,201 million, 4 percent more than a year earlier. Leading crops in value were lettuce and tomatoes whose combined total accounted for 36 percent of the U. S. total.

The 1968 strawberry crop of 523 million pounds, was 9 percent more than last year and 4 percent above average. Production for fresh market accounted for 64 percent of the 1968 strawberry crop and processing 36 percent. Also included in this report are estimates for production of mint for oil, which was valued at \$28.0 million in 1968.

The five leading States in the 1968 production of fresh vegetables and melons were California, Florida, Texas, Arizona, and New York. These States accounted for 64 percent of the harvested acreage, 70 percent of the production, and 76 percent of the value of the vegetables and melons produced in the United States.

LEADING FRESH MARKET VEGETABLE STATES IN 1968

Rank	Harvested Acreage		Production		Value	
	State	Percent of total	State	Percent of total	State	Percent of total
1	California	27.0	California	37.5	California	38.9
2	Florida	15.5	Florida	14.4	Florida	20.0
3	Texas	12.2	Texas	8.1	Texas	7.5
4	Arizona	4.5	Arizona	5.4	Arizona	5.6
5	New York	4.3	New York	4.8	New York	3.6

Estimates in this publication relate primarily to fresh market production. While estimates for many vegetable crops include only fresh market production, those for a few crops, such as broccoli, cauliflower, and carrots, include substantial quantities processed. For asparagus and strawberries, which are perennial crops providing production for both fresh market and processing outlets from the same acreage, a utilization breakdown is given in addition to total production.

(Continued on page 63.)

"Effective January 1, 1969, the Statistical Reporting Service plans to discontinue calculation and publication of 5-year averages that appear in this report. The report will contain data for the current and the two preceding years. It is believed that changes in agriculture have decreased the value of the five-year averages for making comparisons."

1/ See text.

2/ Includes small quantities of production in those States in which separate estimates of fresh market and processing production are not prepared.

3/ Included with fresh market to avoid disclosure.

* Includes some quantities not marketed and excluded in computing value: Mid-Spring, North Carolina, 200,000 pounds for fresh market in 1967; Late Spring, Oregon, 4,200,000 pounds for processing in 1967.

1/ See text.

In this publication, the volume of vegetables sold for fresh market use is valued at f.o.b. shipping point, except garlic, for which prices are reported annually on a field run basis at the packinghouse door. The volume sold for processing is valued at the processing plant door--i.e., "equivalent returns at packinghouse door." For vegetables sold both for fresh consumption and for processing, total value is the sum of the values for both types of use. Per unit value is the quotient derived by dividing total value by total quantity. "Per unit value" is not in general a "price" and is not generally used for parity purposes except where one or the other types of utilization is negligible.

"Acreage for harvest" in this summary embraces total acreage available for harvest including mature acreage abandoned or only partially harvested because of low prices, shortage of farm labor, and other economic factors. Planted acreage in this report includes, in addition to acreage for harvest, acreage lost or abandoned due to natural causes and acreage abandoned prior to reaching maturity because of economic conditions. Acreage lost and replanted to the same crop early enough to be harvested in the season for which it was originally intended, is counted only once. Acreage lost and replanted to the same crop for harvest in a later season is considered to have been planted in both seasonal classifications but is included as acreage for harvest in the second season only. Acreage lost and replanted to another vegetable crop is included as planted acreage in estimates for both crops, but as acreage harvested for the second crop only. Both planted and harvested acreage published for asparagus and strawberries include only bearing acreage and exclude non-bearing acreage planted for harvest in future marketing seasons. Value is for the crop year and does not correspond to calendar year income. All 5-year averages of State and group totals are simple averages of annual data.

This summary provides fresh market estimates for the 27 principal vegetables and melons grown commercially in the more important producing States. These estimates provide basic statistics on over 80 percent of the national output of all vegetables and melons grown for fresh market sale.

These data are based upon information secured from growers, shippers, processors, public agencies, and other sources.
